### **TNI for COPD**

*More Quality of Life by **Therapy with Nasal Insufflation***

TNI the more compliant = the more efficient NIV

TNI medical AG presents at Medica 2014 their new TNI **softFlow** systems that ensure the latest findings for a side-effect free, high quality treatment for clinical and home care use.

In Germany alone 10 percent of the total population are suffering from COPD which is one of the most fast growing diseases and an enormous challenge of all health care systems worldwide. Current standards treating these patients in home care have significant problems and disadvantages. TNI medical AG is targeting a cost effective therapy which is adapted to the patients individually.

Therapy with Nasal Insufflation supplies the patient with a constant, warm and humidified air flow, if necessary combined with oxygen, by a thin sound optimized nasal prong applicator. This leads to an improvement of ventilation with a high therapy acceptance and excellent therapy results.

“Our long lasting active research work resulted in consequent enhancements of our TNI systems”, emphasizes Ewald Anger, chairman of TNI medical AG. “With our new TNI **softFlow** systems we are able to comply clinical requirements and to continue the following homecare therapy identically and safe.
